Update tailwind.config.js

Here's a concise explanation of the tailwind.config.js file, breaking down each row or section:

Basic Configuration

javascript

Copy code

```
const { createGlobPatternsForDependencies } = require('@nx/angular/tailwind');
const { join } = require('path');
```

- **Purpose:** These are required dependencies:
 - createGlobPatternsForDependencies: Generates patterns to include Tailwind styles from all dependencies.
 - join: Used to construct file paths.

content Section

javascript

Copy code

```
content: [
  join(__dirname, 'src/**/!(*.stories|*.spec).{ts,html}'),
  ...createGlobPatternsForDependencies(__dirname),
],
```

- **Purpose:** Specifies the files where Tailwind should look for class usage.
 - join(__dirname, 'src/**/!(*.stories|*.spec).{ts,html}'): Includes all .ts and .html files in the src directory but excludes *.stories and *.spec files.
 - ...createGlobPatternsForDependencies(__dirname): Includes styles from dependent libraries (helpful in Nx workspaces).

theme Section

javascript

Copy code

```
theme: {
  fontFamily: {
    'sans': 'Inter var, ui-sans-serif, system-ui',
    'serif': 'Inter var, ui-sans-serif, system-ui',
  },
  fontSize: {
    sm: '0.875rem',
    base: '1.35rem',
    xl: '1.55rem',
    '2xl': '1.563rem',
    '3xl': '1.953rem',
    '4xl': '2.441rem',
    '5xl': '3.052rem',
  },
  extend: {},
},
```

- **Purpose:** Customizes the design tokens for your project.
 - fontFamily: Defines default fonts for sans and serif.

- `fontSize`: Customizes font sizes for specific classes like `sm`, `base`, `xl`, etc.
- `extend`: A placeholder to add custom styles later.

daisyui Section

```
daisyui: {
  themes: [
    {
      'fantasy': {
        primary: '#0000ff',
        'primary-content': 'white',
        secondary: '#F6F6F6',
        neutral: '#E8E8E8',
      },
    },
  ],
  base: true,
  styled: true,
  utils: true,
  prefix: "",
  logs: true,
  themeRoot: ':root',
},
```

- **Purpose:** Configures **DaisyUI** (a Tailwind CSS plugin for themes and components).
 - `themes`: Defines a custom theme named `fantasy` with colors for primary, secondary, neutral, etc.
 - `base`, `styled`, `utils`, `logs`: Enable DaisyUI features like base styles, utility classes, and logging.
 - `themeRoot`: `:root`: Adds CSS variables to the `:root` element for theme customizations.

plugins Section

```
javascript
Copy code
plugins: [
  require('@tailwindcss/typography'),
  require('daisyui'),
],
```

- **Purpose:** Adds plugins to extend Tailwind functionality.
 - `@tailwindcss/typography`: Adds pre-styled typography utilities.
 - `daisyui`: Enables DaisyUI components and theming.

Simplified Overview

- **Dependencies:** Import required modules for path handling and Nx compatibility.
- **Content:** Defines files where Tailwind should scan for class usage.
- **Theme:** Customizes fonts, font sizes, and other styles.
- **DaisyUI:** Configures a custom theme for easy styling using DaisyUI.
- **Plugins:** Adds plugins for extra functionality.
